

Docker Database Project

Assignment: D3 - Create Your Project Database in Docker

1. Start the Database

Run the following command in your terminal from the project directory:

```
docker compose up
```

To run in background mode (detached):

```
docker compose up -d
```

2. Stop the Database

To stop the running container:

```
docker compose down
```

To stop and remove all data (including volumes):

```
docker compose down -v
```

3. Connect to the Database

Method 1: Inside the container (recommended)

```
docker exec -it my_project_db psql -U student -d projectdb
```

Method 2: From your host machine (if PostgreSQL is installed locally)

```
psql -h localhost -p 5432 -U student -d projectdb
```

4. Verify the Database

Once connected to PostgreSQL, run these SQL commands:

```
\dt
```

```
SELECT * FROM Customer;
```

```
SELECT * FROM Orders;
```

Expected output:

- The \dt command should show two tables: customer and orders
- The SELECT statements should return sample data inserted from the init-db scripts
